ABSTRACT

The purpose of this correlation research is to investigate the smoking-avoidance behaviors of secondary school students, on one hand, and the correlation among attitude towards smoking-avoidance, emotional quotient and smoking-avoidance behaviors of secondary school students, on the other. It is also to find out the predictability of attitudes towards smoking avoidance and emotional quotient on their smoking-avoidance behaviors. The samples of the study were 541 secondary school students who studied in Amphoe Mueang, Chiangrai Province, during the second semester of year 2006. The elicitation tools used in this research were 1) the demographic questionnaire, 2) the smoking-avoidance behaviors scale, 3) the attitude towards smoking-avoidance scale and 4) the Thai Emotional Intelligence Screening Test. The results showed that:

1. Attitudes towards smoking-avoidance of secondary school students and their emotional quotient are both positively associated with their smoking-avoidance behaviors ($r = 0.78$ and 0.43 respectively: $p < 0.001$)

2. Attitude towards smoking-avoidance behavior of secondary school students and their emotional quotient in competence structure were co-predictor of their smoking-avoidance behaviors ($R^2 = 0.62$; $p < 0.001$). Nevertheless, the total of emotional quotient scores, emotional quotient in virtue structure and that in happiness structure were not co-predictor of their smoking-avoidance behaviors.
