LIST OF FIGURES

	LIST OF FIGURES	
Figu	re	Page
2.1	Whiteware compositions composed of clay, feldspar, and silica (quarts).	5
2.2	Structural units of SiO ₄ tetrahedra: (a) diagram of silicate unit with each	
	SiO tetrahedra sharing an oxygen atom, (b) a silicate unit which the	
	silicon atom (Si) is surrounded by four oxygen atoms (oxygen	
	polyhedra) and (c) linked silicate units which form the network in glass.	8
2.3	Two-dimensional presentation of an oxide M_2O_3 in (a) the crystalline	
	form and (b) the glass form.	8
2.4	Reaction between sodium oxide and silica tetrahedral. The sodium oxide	
	contributes one of the non-bridging oxygen ions which interrupt the	
	continuity of the silica network.	10
2.5	Two-dimensional representation of the structure of sodium silicate glass	
	(The structure is shown in a simplified form since only three of the four	
	oxygen ions surrounding each silicon ion are depicted.)	11
2.6	Aluminium in a silicate network (The structure is shown in a simplified	
	form; the true structure is three-dimensional, the AlO ₄ and SiO ₄	
	groups having tetrahedral configurations.). The alkali metal ion (M^{+})	
	such sodium maintains electroneutrality.	12
2.7	Applications of dental porcelain-based ceramics: (a) inlay, (b) all ceramic	
	jacket crown and (c) bridge.	13
2.8	Methods of strengthening dental porcelain: (a) enameling of metals,	
	(b) enameling of high strength crystalline ceramics and (c) production	
	of pre-stressed surface layers in dental porcelain via ion-exchange.	14
2.9	In all-ceramic restoration, incidental light is transmitted and partially	
	diffused through. On the other hand, when entering a PFM restoration,	
	light is primarily reflected	17

2.10	The unit cell of tetragonal leucite (23°C) viewed parallel to {111}. The	
	potassium atoms (spheres) reside along non-intersecting {111}	
	channels; such channels are interconnected via side channels	
	perpendicular to the main channel axis (shown as lines radiating from	
	the central K atoms to neighbouring K atoms in adjacent channels; the	
	distances between such K atoms are approximately 4.7 Å). Directions	
	of the side channels are indexed.	20
2.11	View parallel to {110} showing the arrangement of potassium atoms and	
	the six-fold tetrahedral rings along the $\{111\}$ direction. (a) Below T_C ,	
	the potassium atoms (spheres) are off-centered with respect to the	
	channel axis (diagonal line). (b) At 800°C, in the cubic phase, the	
	potassium atoms are aligned parallel to the (triad) channel axis, and the	
	rings assume an undistorted profile. The average distance between the	
	potassium ions parallel to this axis is approximately 6 Å.	21
2.12	Position of feldspathic ceramic bodies for denture teeth and for ceramo	
	-metalic restorations in the ternary-phase diagram $K_2O\text{-}Al_2O_3\text{-}SiO_2$.	
	Phase diagram reprinted by permission of American Ceramic Society.	22
2.13	Micrograph of crystalline phase reinforced porcelains; (a) leucite, (b)	
	lithium disilicate, (c) zirconia, and (d) fluoro-apatite.	24
2.14	Schematic of microcracks during cooling of porcelain from the glass	
	transition temperature to room temperature. As the porcelain cools	
	down from the firing temperature, the leucite contracts more than the	
	surrounding glass matrix, owing to its higher coefficient of thermal	
	expansion and the cubic-to-tetragonal phase transformation. At some	
	temperature below the glass transition temperature of the glass matrix,	
	the walls of the cracks around the leucite particles separate due to the	
	contraction of the leucite particles.	26
2.15	Schematic representation of the three polymorphs of ZrO_2 : (a) cubic , (b)	
	tetragonal, and (c) monoclinic.	33

2.16	Schematic illustrations of toughening mechanisms in ceramic-matrix	
	composites: (a) ductile-phase toughening, (b) fiber toughening, (c)	
	transformation toughening, and (d) microcrack toughening.	36
2.17	(a) Niihara's classification of nanocomposite types, based on matrix	
	grain size and second-phase particle size. (b) A new classification,	
	Kuntz in which the matrix phase is continuously nanocrystalline while	
	the second phase varies, leading to four nanocomposite types.	39
3.1	Flow chart of green sample preparations.	43
3.2	Industrial shaping process of dental porcelain by slip casting technique:	
	(1) pouring slip into the metal mold, (2) excess moisture removing, (3)	
	surface flattening, (4) unpacking, (5) green specimen, and (6) sintered	
	specimens.	44
3.3	Vacuum furnace (for reducing sample porosity after sintering process).	45
3.4	Flow chart of the specimen preparations.	46
3.5	Digital scale was used for measuring density by the Archimedes principle.	47
3.6	X-ray diffractometer.	49
3.7	Scanning electron microscope, equipped with EDX analyzer.	49
3.7 3.8	Scanning electron microscope, equipped with EDX analyzer. Diagram of uniaxial flexural strength test shows rectangular-shaped	49

4.3		
4.3	SEM micrograph of (a) dental porcelain, (b) CG, (c) G5, (d) G6, (e) G7	62
4.45	and (f) G8 samples.	63
4.4	Representative (a) SEM micrograph of CG samples and their correspon-	
	ding EDX analysis, indicating the chemical compositions of (b) glassy	S\\
	matrix, (c) leucite and (d) ZrO ₂ phases, respectively.	64
4.5	Impression of a Vickers indenter producing symmetric cracks, where the	
	cracks are propagating along the glassy phase of the matrix. The crack	
	patterns are propagating normally to the orientation of the crystalline	
	reinforced phase.	66
4.6	SEM micrograph of cracks in the dental porcelain ceramics propagated	
	directly through the glassy phase.	67
4.7	Impression of a Vickers indenter producing symmetric cracks, where the	
	cracks are propagating along the glassy phase of the matrix and crystalline	
	reinforced phase.	67
4.8	SEM micrograph of (a) and (b) G6; (1) a branch of the intergranular	
	crack is propagating through a glassy phase, (2) transgranular cracking	
	through the grain of crystalline reinforced phase and (3) microcracks are	
	visible in the glassy matrix and at the interface between particles and	
	glass.	68
4.9	The comparative hardness data of ZrO ₂ -reinforced porcelain ceramics.	69
4.10	Weibull plots of uniaxial flexure strength data for ZrO ₂ -reinforced	
	porcelain ceramics.	71
4.11	The cumulative Weibull plots of probability of failure data for ZrO ₂ -	
	reinforced porcelain ceramics.	73
4.12	The comparative all flexural strength data of ZrO ₂ -reinforced porcelain	
	Oceramics. OV Chiang Mai Univ	73
4.13	The comparative all fracture toughness data of ZrO ₂ -reinforced porcelain	
	ceramics.	75 🗎 🗍
