1. Physical method

1.1 Color analysis

CIE L, a* and b* values were measured with a colorimeter (Chrometer, Minolta CR-300, Japan). Samples of juice were prepared by pouring 30 ml of orange juice into a white plastic cup.

L value = a lightness factor with a value range of 0-100 %.

a* and b* value = chromaticity coordinates, with a value range from (-) 60 to (+) 60.

Total color difference (ΔE^*) was calculated using a formula of : $(\Delta L^2 + \Delta a^{*2} + \Delta b^{*2})^{1/2}$ (Lee and Coates, 1999).

Browning index was calculated from $[(C_{nt} - C_{ro})^2 + [(C_{yt} - C_{yo})^2]^{1/2}$ (Suklampoo, 2003).

C_{nt} = a* value of samples.

C_{ro} = a* value of control.

C_{yt} = b* value of samples.

C_{yo} = b* value of control.

1.2 Cloud loss analysis (Farnworth *et al.*, 2001)

Cloudiness of orange juice samples was determined by measuring % transmittance (%T) in a spectrophotometer at a wavelength of 640 nm.

1.3 Viscosity analysis

Viscosity of orange juice was measured using a viscometer. An amount of 8 ml orange juice was poured into a 100 cylinder and placed in the correct position under the viscometer equipment. The orange juice sample was measured using a viscometer speed at 200 rpm. Measurements were conducted at room temperature.

1.4 Yield analysis

The yield of orange juice was measured based on a formula:

$$\% \text{ yield} = \frac{\text{weight of orange juice}}{\text{weight of orange fruit}} \times 100$$

2. Chemical method

2.1 Total Titratable Acidity analysis (AOAC, 2000)

Pipette 10 ml orange juice sample into a flask and dilute the sample with distilled water. Then pipette 10 ml diluted solution sample into another flask. Drop phenophthalein 2-3 drops and titrate the sample with 0.1 M NaOH until sample reach the end point (sample solution became pink that was persisted for 30 s).

$$\% \text{ Citric acid} = \frac{\text{ml of } 0.1 \text{ M NaOH} \times 0.1 \times 0.007 \times 100}{\text{weight of sample}}$$

2.2 Moisture and Total solid analysis (AOAC, 2000)

Heated an empty moisture dish in a hot air oven about 20-30 min. Cool in a desiccator and weigh the dish. Into the cooled and weighed dish (provided with cover), previously heated to $100 \pm 3^\circ\text{C}$, accurately weigh 2 g of orange juice sample. Uncover the dish and dry the dish with its cover and contents for 3 h in an oven provided with opening for ventilation and maintained at $100 \pm 3^\circ\text{C}$. Cover the dish while it is still in the oven, transfer to a desiccator, and weigh the dish soon after it reached a room temperature. Dry the sample again for several times until the sample has a constant weight.

$$\% \text{ moisture content} = \frac{\text{Loss in the sample weight during drying} \times 100}{\text{Initial weight of the sample}}$$

$$\% \text{ total solid} = 100 - \% \text{ moisture content}$$

2.3 Sugar analysis (AOAC, 2000)

2.3.1 Reducing sugar

Transfer 15 ml of orange juice sample into a 100 volumetric flask and adjust to 100 ml with deionized water. Add 5 ml of Carrez I and II solutions. Shake and adjust to 200 ml with distilled water. Put aside the mixed solution for precipitation about 20 min and filter the solution with a Whatman filter paper no. 4. Pour the solution filtrate into a 50 ml burette and pipette 5 ml of Fehling solution no. 1 and 2 into a flask.

Heat the Fehling solution on a hot plate and add one drop of methylene blue indicator. Titrate the Fehling solution with the filtrate solution in the burette until the Fehling solution has a color of orange-red.

2.3.2 Inversion sugar

Pipette 50 ml of filtrate solution from the previous determination into a volumetric flask. Add 10 ml of 6.34 N hydrochloric acid. Place the volumetric flask in a water bath at 70°C for 10 min and cool immediately. Make the mixture solution neutral with 5 N NaOH and adjust to 100 ml with water. Do titration following the procedure of reducing sugar.

$$\% \text{ sucrose (S)} = \% \text{ different between } D_1 \text{ and } D_2 \times 0.95$$

$$\% \text{ total sugar} = D_1 + S$$

D_1 = % Reducing sugar

D_2 = % Inversion sugar

2.4 Protein analysis (AOAC, 2000)

Place weighed sample (15 ml) in a digestion flask. Add 8 g catalyst mixture and 20 ml H_2SO_4 . Place the flask in an inclined position in a digestion machine and heat the machine gently until frothing ceases. Continue boil briskly until the solution clears (~ 2 h).

Cool, add distilled water to dilute the mixture solution and pour into a distilling flask. Add 400 ml H_2O (ammonia-free water) and a few Zn granules to prevent bumping. Immediately immerse a condenser tip into a receiver that contains 50 ml of 2% boric acid solution in a 500 ml flask and 5-7 drops indicator. Add 75 ml of 50% sodium hydroxide using a funnel into the distilling equipment. Rotate the distilling flask to mix the contents thoroughly; then heat until all NH_3 has been distilled (≥ 150 ml distillate). Remove the receiver, wash the tip of the condenser and titrate excess standard acid in distillate with 0.05 M H_2SO_4 . Do blank determination to correct any nitrogen content in reagents.

$$\%N = \frac{(V_a - V_b) \times N.H_2SO_4 \times 1.4007}{W}$$

V_a = ml of standard acid for sample titration

V_b = ml of standard acid for blank titration

$N.H_2SO_4$ = normality acid

W = weight of sample (g)

%Protein = %N x factor (factor value = 6.25)

2.5 Fat analysis (AOAC, 2000)

Weigh sample (0.5-1.0 g) and place into a separated funnel. Add 10 ml water and shake. Add 1.25 ml ammonia solution, 10 ml ethyl alcohol and 25 ml diethyl ether, close with a stopper and shake vigorously for 1 min. Carefully release the pressure of the funnel. Add 25 ml petroleum ether, close the stopper and shake vigorously for 1 min. Carefully release the pressure. Let stand until an upper liquid is practically clear (~ 30 min). Pour the upper clear solution into a previously weighed beaker. Take the beaker to stand in a hood until diethyl ether and petroleum are evaporated and place the beaker in a hot air oven ($T = 102 \pm 2^{\circ}\text{C}$) for 2 h. Cool in a desiccator and weigh the sample.

$$\% \text{Fat content} = \frac{(W_2 - W_3) \times 100}{W_1}$$

W_1 = Weight of sample

W_2 = Weight of beaker and fat

W_3 = Weight of beaker

2.6 Ash analysis (AOAC, 2000)

Weigh 3-5 g sample into an ashing dish that has been heated, cooled in a desicator, and weighed soon after reaching room temperature. Before ashing the sample, heat the sample on a bunchen lamp until no more black smoke appeared. Then ash the sample in a muffle furnace at 550°C until light gray ash results or until it reaches a constant weight. Cool in a desicator and weigh soon after reaching room temperature.

$$\% \text{Ash} = \frac{\text{Weight of ash} \times 100}{\text{Weight of sample}}$$

2.7 Fiber analysis (AOAC, 2000)

Weigh 5 g sample into a 500 ml beaker. Transfer 1.25 M sulfuric acid (200 ml) into the beaker. Boil the sample solution on a hot plate for 30 min. Filter the sample solution using a Whatman paper no. 4 until it dries by applying a vacuum pump and wash the residue with boiling water until the sample does not have acid (do a test using a litmus paper). Place 200 ml of 1.25% NaOH into a beaker and boil the beaker on a hot plate. Wash the residue on the filter paper with distilled water. Boil the sample again on the hot plate for 30 min. Filter the sample using a Whatman paper no. 4 and wash the residue with boiling water. Transfer the filter paper with the sample residue into a crucible and dry at $102 \pm 2^{\circ}\text{C}$ for 3 h. Cool in a desicator and weigh. Then ash the residue for 2 h at $550 \pm 10^{\circ}\text{C}$, cool in the desicator, and weigh.

$$\text{% Crude fiber} = \frac{(W_4 - W_3 + W_2) + (W_5 - W_3)(100 - \%H_2O - \%fat)}{W_1}$$

W_1 = Weight of sample

W_2 = Weight of filter paper

W_3 = Weight of crucible

W_4 = Weight of crucible + filter paper + sample after drying

W_5 = Weight of crucible + ash

% H_2O = Moisture content of sample

%fat = Fat of sample

2.8 Carbohydrate content (AOAC, 2000)

Carbohydrate content was determined by measuring the difference of the original sample minus the moisture, protein, crude fat and mineral contents calculated at the same moisture level.

2.9 Pectin esterase (PE) activity

Quantitative measurement of PE was based on a method reported by Bull *et al.* (2004). The orange juice sample was mixed properly by inverting the bottle several times and 5 ml of the juice was transferred into 50 ml of a 1% pectin substrate solution in 0.2 M sodium chloride. The sample was titrated to pH 7.5 with 0.2 N NaOH. Then 0.05 N NaOH was titrated into the sample to maintain the sample pH at 7.5 for 30 min. The volume of 0.05 N NaOH consumed during this time was recorded. The PE activity expressed as PE units (PEU) per gram soluble solids was calculated by using the formula:

$$\text{PEU/g.s.s.} = \frac{\text{ml NaOH} \times \text{normality of NaOH}}{\text{Weight of sample} \times 30 \text{ min} \times {}^{\circ}\text{Brix}/100}$$

2.10 Flavor analysis

The flavor components of orange juice samples Gas Chromatography – Mass Spectrophotometer (GC-MS) were identified. For this portion of the work, a GC 6890 Agilent Technologies equipped with a 30 m x 0.25 mm ID column and 0.25 μm film thickness was used. The GC was linked to a Hewlett Packard Model 5973 (EI) mass spectrometry detector. The initial oven temperature was maintained at 50 $^{\circ}\text{C}$ for 1 min. It was then raised at 10 $^{\circ}\text{C}/\text{min}$ to 70 $^{\circ}\text{C}$. After that, it increased to 140 $^{\circ}\text{C}$ at a rate of 5 $^{\circ}\text{C}/\text{min}$ and maintained at 140 $^{\circ}\text{C}$ for 11 min. Finally it increased to 220 $^{\circ}\text{C}$ at a rate of 10 $^{\circ}\text{C}/\text{min}$ without a final hold time. The injection port and ionizing source were kept at 230 $^{\circ}\text{C}$, and the transfer line was kept at 230 $^{\circ}\text{C}$. Helium was used as a carrier gas and the flow through the column was maintained at 1.0 ml/min. Identification of the components was done by comparison of mass spectra and retention time data with those of authentic compounds supplement with standard mass spectra.

3. Microbiological analysis

3.1 Total Plate Counts. The number of total microorganisms were enumerated using a pour plate method on Orange Serum Agar. Incubation was performed at 35°C for 48 h (Jia *et al.*, 1999).

3.2 Total yeast and moulds were enumerated on Potato Dextrose Agar acidified to pH 3.5 with 10% tartaric acid by a pour plating technique. The incubation for total yeast and mold counts was done at 22°C for 5 days (Jia *et al.*, 1999).

3.3 Lactic acid bacteria were enumerated on de Man Rogosa Sharpe (MRS) agar. The incubation for lactic acid bacteria counts was done anaerobically at 35°C for 3 days (de Man *et al.*, 1960).

4. Nutritional analysis

4.1 Vitamin C content (AOAC, 2000)

Pipette 50 ml sample into a 100 ml volumetric flask. Add 25 ml of 0.4% oxalic acid and dilute with distilled water. Then pipette 10 ml of the diluted sample into a 125 ml flask. Titrate this sample with an indophenol standard solution. At the end point, an excess unreduced dye will produce a rose pink color in solution.

A similar procedure as above is done for 0.05 g of vitamin C standard.

1 ml of vitamin C standard 1 ml had a vitamin C content of 0.2 mg

10 ml of vitamin C standard 10 ml had a vitamin C content $0.2 \times 10 = 2$ mg

If 2 mg of vitamin C used an indophenol standard solution of a ml, then
the sample that used a b ml indophenol standard solution would have a vitamin C content of: $= \frac{2 \times b}{a}$ mg

Since the initial sample volume was 50 ml then for 100 ml of orange juice sample, the sample would contain vitamin C of: $\frac{2 \times b \times 100}{a \times 50}$ mg/100 ml

4.2 Carotenoid content (AOAC, 2000)

4.2.1 Make a standard curve of carotenoid

Place a 0.0005 g of standard beta-carotene (β -carotene) into a beaker. Dilute the standard β -carotene with 2.5 ml chloroform. Pour the β -carotene solution into a 50 ml volumetric flask and adjust the volume with hexane. Pipette 5 ml of the standard solution into a 50 ml volumetric flask and adjust the volume with hexane. Then pipette 1, 2, 3, 4, 5, 6, 7, 8 and 9 ml of the standard solution into 10 ml volumetric flasks and adjust with a 10% acetone in hexane solution. Take the solution that has the highest concentration of β -carotene solution to find the highest absorbance using a wavelength range between 400-500 nm in a spectrophotometer. Use 10% acetone in hexane as a blank. Choose the wavelength that shows the highest absorbance and measure the absorbance of the other solutions (1, 2, 3, 4, 5, 6, 7 and 8 ml). Make a standard curve between the concentrations of the standard β -carotene solution and the absorbance values.

4.2.2 Determination of carotenoid in sample

Weigh 5 g sample and place the sample into a flask. Add 100 ml of 10% acetone in hexane, stir for 10 min and filter using a funnel and Whatman paper no. 4. Pour the clear solution into a separate funnel and pour 100 ml distilled water into the separate funnel to separate acetone from the solution. Shake the funnel and pour the acetone in water into a beaker. Filter the carotenoid in hexane solution and place the carotenoid in hexane solution in a hood to evaporate the hexane from carotenoid. Then dilute the dry carotenoid with 10% acetone in hexane solution in a 50 ml volumetric

flask. Measure the absorbance of the sample solution with a spectrophotometer at 450 nm (Use 10% acetone in hexane as a blank). Calculate the carotenoid content in orange juice using the β -carotene standard curve (Fig. C1).

From standard curve

$$y = 1.2808x - 0.0072$$

y = absorbance value of carotenoid.

x = carotenoid content (ppm).

Take the x value from the standard curve equation to find the carotenoid content in the orange juice sample.

Calculation to find carotenoid content

1000 ml of a dilute solution has carotenoid = x mg.

50 ml of a dilute solution has carotenoid = $(x/1000) \times 50$ mg.

Carotenoid content from 5 g sample

5 g orange juice has carotenoid = z mg.

1g orange juice has carotenoid = $z/5$ mg.

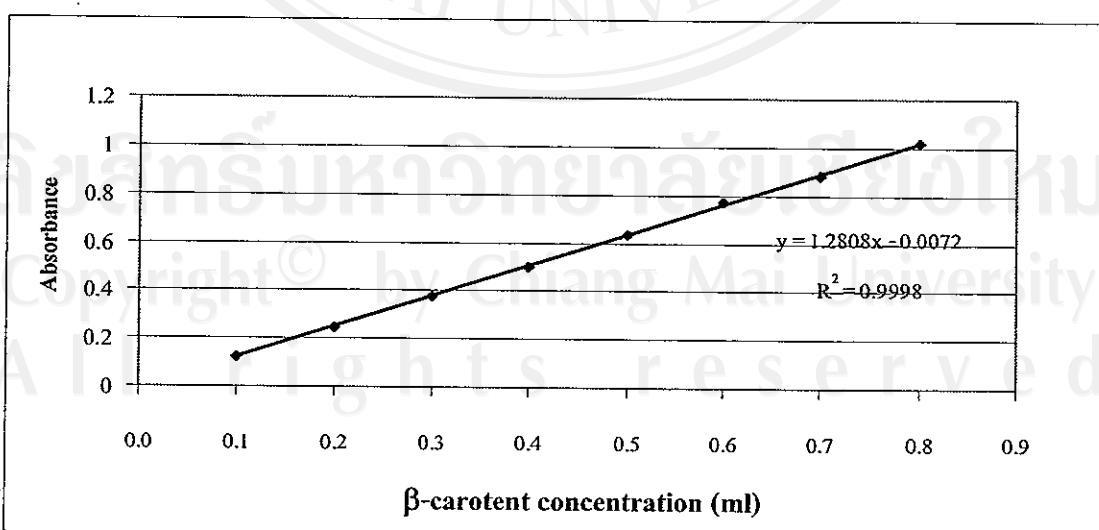

Fig. C1 The standard curve of β – carotene in 10% acetone in hexane solution

Curriculum Vitae

Name: Kanyapat Kritsawan

Date of birth: 27/10/1977

Academic background:

- Sampathong Witthayakom School Chiang Mai,
1989-1994
- Faculty of Science, Chiang Mai University
B.S. (Biology), 1995-1998
